

Final Project Rubric – CSE 3000 (Fall 2024)

The final project for this course is a group presentation, given on one of the last two days we are scheduled to meet. The purpose of this presentation is for you to apply the philosophical – social and ethical – concepts we have been talking about throughout the course to CSE. This could be a project from a different course you have been working on, or a technology you have researched, or something you have written or built throughout your time studying CSE.

The presentation will be roughly 5-10 min, and groups will have 3 or 4 members. I will let you decide your own teammates but reserve the right to alter groups if circumstances necessitate. The presentation can take the form of a PowerPoint, a tech demo, or any other type of live, in-person presentation. What I will be looking for is:

- Clear communication of the technical details to someone not as familiar with them as you are (**public communication of your expertise**)
- Explanation of the social impact of what you are presenting on
- Explanation of any duty-of-care for the experts involved

Grading: *(Total points: 20)*

Social impact: *(8 points)* This is where you show me how your topic impacts society. Each student should speak on this topic. Observations can include things like:

- User experience
- Effects on daily life, or some common task(s)
- Impacts on policy or government

Duty-of-Care: *(8 points)* What kinds of moral or social duties-of-care might the experts have to the users of this technology, or to those it will impact? Each student should speak on this topic. Examples might include:

- What does the duty look like?
- How should they perform this duty?

Communication: *(4 points)* Quickly providing clarity to a non-technical audience is a valuable skill that will help you succeed. Please ensure that your explanations of the technology/technical details are accessible to a broad audience.
